## 1 Problem 1

#### Part A:

#### i. Linear Problem Formulation

Let each route be represented as variables of the form "SourceDestination." For example a route from Plant 1 to Warehouse 1 would be "p1w1."

Objective function:

#### Minimize:

```
10~p1w1+15~p1w2+11~p2w1+8~p2w2+13~p3w1+8~p3w2+9~p3w3+14~p4w2+8~p4w3+5~w1r1+6~w1r2+7~w1r3+10~w1r4+12~w2r3+8~w2r4+10~w2r5+14~w2r6+14~w3r4+12~w3r5+12~w3r6+6~w3r7
```

#### Subject To:

```
Supply Constraints:
```

```
\begin{array}{l} p1w1 + p1w2 = 150 \\ p2w1 + p2w2 = 450 \\ p3w1 + p3w2 + p3w3 = 250 \\ p4w2 + p4w3 = 150 \end{array}
```

```
Demand Constraints:
```

```
w1r1 = 100

w1r2 = 150

w1r3 + w2r3 = 100

w1r4 + w2r4 + w3r4 = 200

w2r5 + w3r5 = 200

w2r6 + w3r6 = 150

w3r7 = 100
```

### Balancing Constraints:

```
\begin{array}{l} p1w1+p2w1+p3w1-w1r1-w1r2-w1r3-w1r4<=0\\ p1w2+p2w2+p3w2+p4w2-w2r3-w2r4-w2r5-w2r6<=0\\ p3w3+p4w3-w3r4-w3r5-w3r6-w3r7<=0 \end{array}
```

#### Non-negativity Constraints:

p1w1, p1w2, p2w1, p2w2, p3w1, p3w2, p3w3, p4w2, p4w3, w1r1, w1r2, w1r3, w1r4, w2r3, w2r4, w2r5, w2r6, w3r4, w3r5, w3r6, w3r7 >= 0

#### ii. LINDO Code and Output

```
MIN 10 p1w1 + 15 p1w2 + 11 p2w1 + 8 p2w2 + 13 p3w1 + 8 p3w2 + 9 p3w3
 + 14 p4w2 + 8 p4w3 + 5 w1r1 + 6 w1r2 + 7 w1r3 + 10 w1r4 + 12 w2r3
  + 8  w2r4 + 10 w2r5 + 14 w2r6 + 14 w3r4 + 12 w3r5 + 12 w3r6 + 6 w3r7
   p1w1 + p1w2 = 150
   p2w1 + p2w2 = 450
   p3w1 + p3w2 + p3w3 = 250
   p4w2 + p4w3 = 150
   w1r1 = 100
   w1r2 = 150
   w1r3 + w2r3 = 100
   w1r4 + w2r4 + w3r4 = 200
   w2r5 + w3r5 = 200
   w2r6 + w3r6 = 150
   w3r7 = 100
   p1w1 + p2w1 + p3w1 - w1r1 - w1r2 - w1r3 - w1r4 <= 0
   p1w2 + p2w2 + p3w2 + p4w2 - w2r3 - w2r4 - w2r5 - w2r6 \le 0
   p3w3 + p4w3 - w3r4 - w3r5 - w3r6 - w3r7 <= 0
   p1w1 > 0
   p1w2 > 0
   p2w1 > 0
   p2w2 > 0
   p3w1 > 0
   p3w2 > 0
```

p3w3 > 0p4w2 > 0p4w3 > 0w1r1 > 0w1r2 > 0w1r3 > 0w1r4 > 0w2r3 > 0w2r4 > 0w2r5 > 0w2r6 > 0w3r4 > 0 w3r5 > 0w3r6 > 0w3r7 > 0END

NO. ITERATIONS= 13

## iii. Optimal Shipping Routes and Minimum Cost

The optimal shipping routes and quantity of refrigerators per route are:

Route	Refrigerators
P1W1	150
P2W1	200
P2W2	250
P3W2	150
P3W3	100
P4W3	150
W1R1	100
W1R2	150
W1R3	100
W2R4	200
W2R5	200
W3R6	150
W3R7	100

The optimal minimum cost is \$17,100

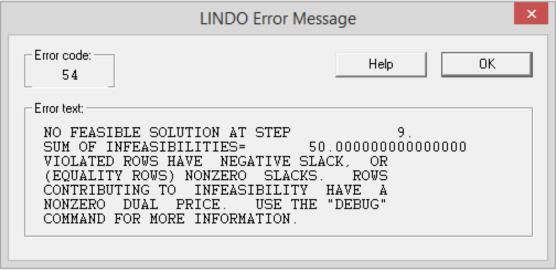

#### Part B:

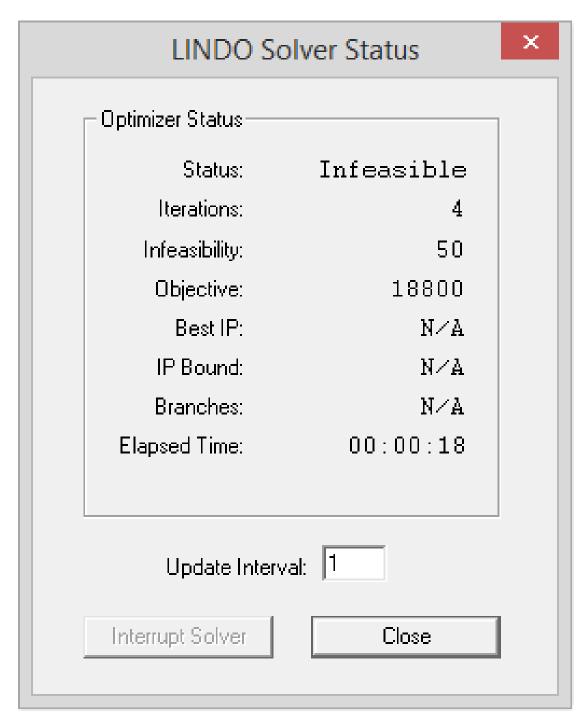

To remove Warehouse 2 and all its associated routes, we remove all variables in our equation that contain "w2" in it. The resulting LINDO code is as follows:

```
MIN 10 plw1 + 11 p2w1 + 13 p3w1 + 9 p3w3 + 8 p4w3 + 5 w1r1 + 6 w1r2
   + 7 w1r3 + 10 w1r4 + 14 w3r4 + 12 w3r5 + 12 w3r6 + 6 w3r7
ST
   p1w1 = 150
   p2w1 = 450
   p3w1 + p3w3 = 250
   p4w3 = 150
   w1r1 = 100
   w1r2 = 150
   w1r3 = 100
   w1r4 + w3r4 = 200
   w3r5 = 200
   w3r6 = 150
   w3r7 = 100
   p1w1 + p2w1 + p3w1 - w1r1 - w1r2 - w1r3 - w1r4 <= 0
   p3w3 + p4w3 - w3r4 - w3r5 - w3r6 - w3r7 <= 0
   p1w1 > 0
   p2w1 > 0
   p3w1 > 0
```

```
p3w3 > 0
p4w3 > 0
w1r1 > 0
w1r2 > 0
w1r3 > 0
w1r4 > 0
w3r4 > 0
w3r5 > 0
w3r6 > 0
w3r7 > 0
```

Upon execution of the code, we are met with these solution infeasibility notices:

There is no feasible solution here because Warehouse 3's total possible supply (400) is not capable of supporting the combined demand of R4, R5, R6, and R7 (650). On the other hand, Warehouse 1 is in fact capable of supporting R1, R2, R3, and R4 with its 850 supply to 550 demand ratio, but that still does not solve the larger supply chain deficit and feasibility issue. Overall, we need Warehouse 2 to supplement the supply to

R3, R4, R5, and R6 and sufficiently "spread the load" on the warehouses.

#### Part C:

To simulate the limitation of 100 shipments (inbound and outbound) on Warehouse 2, we add two new constraints to our code for Part A. The constraints limit the inbound and outbound shipments to being less than or equal to 100.

#### LINDO Code and Output:

```
MIN 10 plw1 + 15 plw2 + 11 p2w1 + 8 p2w2 + 13 p3w1 + 8 p3w2 + 9 p3w3
  + 14 p4w2 + 8 p4w3 + 5 w1r1 + 6 w1r2 + 7 w1r3 + 10 w1r4 + 12 w2r3
  + 8  w2r4 + 10  w2r5 + 14  w2r6 + 14  w3r4 + 12  w3r5 + 12  w3r6 + 6  w3r7
ST
   p1w1 + p1w2 = 150
   p2w1 + p2w2 = 450
   p3w1 + p3w2 + p3w3 = 250
   p4w2 + p4w3 = 150
   w1r1 = 100
   w1r2 = 150
   w1r3 + w2r3 = 100
   w1r4 + w2r4 + w3r4 = 200
   w2r5 + w3r5 = 200
   w2r6 + w3r6 = 150
   w3r7 = 100
   p1w1 + p2w1 + p3w1 - w1r1 - w1r2 - w1r3 - w1r4 <= 0
   p1w2 + p2w2 + p3w2 + p4w2 - w2r3 - w2r4 - w2r5 - w2r6 <= 0
   p3w3 + p4w3 - w3r4 - w3r5 - w3r6 - w3r7 <= 0
   p1w1 > 0
   p1w2 > 0
   p2w1 > 0
   p2w2 > 0
   p3w1 > 0
   p3w2 > 0
   p3w3 > 0
   p4w2 > 0
   p4w3 > 0
   w1r1 > 0
   w1r2 > 0
   w1r3 > 0
   w1r4 > 0
   w2r3 > 0
   w2r4 > 0
   w2r5 > 0
```

```
w2r6 > 0
w3r4 > 0
w3r5 > 0
w3r6 > 0
w3r7 > 0
p1w2 + p2w2 + p3w2 + p4w2 <= 100
w2r3 + w2r4 + w2r5 + w2r6 <= 100
END</pre>
```

NO. ITERATIONS=

We see that this is a feasible solution, though it raises our optimal cost from \$17,100 to \$18,300.

The optimal shipping routes and quantity of refrigerators per route are:

7

Route	Refrigerators
P1W1	150
P2W1	350
P2W2	100

P3W3	250
P4W3	150
W1R1	100
W1R2	150
W1R3	100
W1R4	150
W2R4	50
W2R5	50
W3R5	150
W3R6	150
W3R7	100

#### Part D:

For some cost  $c_{ab}$  and some route  $x_{ab}$  where their subscripts represent the route from a to b, the objective function is:

$$Min(\sum_{p}\sum_{w}^{t}c_{pw}x_{pw}+\sum_{w}\sum_{r}c_{wr}x_{wr})$$

s.t.

```
(Supply Constraint) For each source node p, where s is supply: \sum_w x_{pw} = s_p (Demand Constraint) For each destination node r, where d is demand: \sum_w x_{wr} = d_r (Balancing Constraint) For each intermediate node w: \sum_p x_{pw} - \sum_r x_{wr} <= 0 (Non-negativity Constraint) For all nodes p and r: x_{pw}, x_{wr} >= 0
```

## 2 Problem 2

#### Part A:

#### i. General Problem Statement

Objective:

```
Min \sum_{i=1}^{n} b_i, for some b representing \sum_{i=1}^{n} |y_i - (a_1x_i + a_0)| s.t.
For each i = 1...n, b_i - (y_i - (a_1x_i + a_0)) >= 0
For each i = 1...n, b_i + (y_i - (a_1x_i + a_0)) >= 0
```

## ii. LINDO Code and Output

```
MIN b1 + b2 + b3 + b4 + b5 + b6 + b7

ST

b1 + 22 a1 + 7 a0 >= 71

b1 - 22 a1 - 7 a0 >= -71

b2 + 22 a1 + 7 a0 >= 71

b2 - 22 a1 - 7 a0 >= 71
```

```

```

The sum of the absolute deviations was 0.

iii. The LAD approach creates a line that adjusts more for outliers, like at x = 2, than the least squares approach. The line goes through y = 0 has a generally steeper slope than the least squares line, and is not shifted by  $a_0$  since it equals zero in this case.
